

Andrew Merritt

Dataset Title: How Education Drives Economic Growth

Motivation: In this dataset I was interested in the relationship between education levels and economic prosperity. In this dataset I was interested in understanding how educational accomplishments have correlate with economic indicators.

Data Description:

Dataset source: Kaggle

Selected Variables:

1. County
2. Literacy Rate
3. GDP (Current USD)
4. GDP Growth (% Annual)
5. GDP per Capita (Current USD)
6. Unemployment Rate (%)

Steps taken to prepare the dataset: To prepare the dataset for use I must first download the .csv file of this dataset. Then I must remove unused columns that are relevant to the selected variables. Then I must ensure that the numeric values are valid and if they aren't valid then I will fix the values to make them valid. In sorting the dataset, it is sorted by the county name starting in descending order A to Z. In sorting from A to Z we can find a certain country easier when it comes time to apply into the code.
